

## ACUTE HEMOLYSIS AND METHEMOGLOBINEMIA IN G6PD DEFICIENCY AFTER ACALYPHA INDICA INGESTION

**Rattanasunya P**

*Department of Emergency Medicine, Chao Phya Abhai Bhu Bejhr hospital, Ministry of Public Health, Thailand*

**Objectives:** To report a case of Glucose-6-phosphate dehydrogenase (G6PD) deficiency who developed acute hemolysis and methemoglobinemia after *Acalypha indica* ingestion

**Methods:** A review of patient's information and Pubmed database searches was performed to investigate the case

**Results:** A 59 years old patient no significant past medical history, presented with fatigue and diarrhea for 2 weeks after *Acalypha indica* ingestion. Physical examination revealed pallor, tachypnea, tachycardia and elevated blood pressure without cyanosis. Pulse oximetry showed moderate hypoxemia which could not be improved by oxygen supplementation. Further investigation revealed hemolytic anemia, complete enzyme G6PD deficiency, wide oxygen saturation gap and elevated methemoglobin level

**Conclusions:** *Acalypha indica* ingestion can cause of acute hemolysis and methemoglobinemia in G6PD deficiency patient
